USDA/AMS/FGIS Proficiency Program
Testing for the Presence of Biotechnology-derived Events in Corn and Soybeans
October 2017 Sample Distribution Results

Purpose of USDA/AMS/FGIS Proficiency Program

Through the USDA/AMS/FGIS Corn and Soy Proficiency Program, USDA seeks to improve the overall performance of testing for biotechnology-derived grains and oil seeds. The USDA/AMS/FGIS Proficiency Program helps organizations identify areas of concern and take corrective actions to improve testing precision, capability and reliability.

Program Description and Assessment of Results

The USDA/AMS/FGIS proficiency program report contains inter-laboratory comparisons for the purpose of proficiency testing (i.e. to determine the performance of individual laboratories' ability to detect and/or quantify biotechnology-derived traits in corn or soy as well as to monitor laboratories' continuing performance). The program does not assess the effectiveness of different detection methods for biotechnology-derived traits, nor does it determine the characteristics of fortified samples to a particular degree of accuracy.

In this round of the USDA/AMS/FGIS Proficiency Program sample distribution, one set of samples was used for both qualitative and quantitative analyses. The samples were fortified with various combinations and concentrations of biotechnology-derived traits, and participants had the choice of providing qualitative and/or quantitative results. Qualitative results were scored by computing the "percentage of correctly reported biotechnology-derived traits" in the samples (Tables 1 to 45 and Figure 1 for DNA-based analysis, and Tables 44 to 53 for protein-based analysis). The "percentage false positive" and "percentage false negative" were calculated by dividing the number of incorrectly reported results by the number of "provided negatives" or "provided positives" that were distributed to the participants. It should be noted that trait-specific, DNA-based testing can discern between different traits that express the same protein, (e.g. Roundup Ready™ (RUR) and Roundup Ready™ II (RUR II)), whereas in most instances, construct-specific DNA-based testing or protein-based testing cannot.

Consensus mean values were calculated on the sets of quantitative data shown in Tables 54 to 74, with outliers excluded. Data sets were treated equally with this model, assuming no laboratory effect on outcomes, and are most likely idealistic. To assess accuracy of individual participant's submitted quantitative results for a specified biotechnology-derived event, z-scores (based on: (reported value – consensus mean value) / standard deviation) were computed for each reported quantification result (Tables 54 to 74). Tests for outliers and z-scores assume a normal distribution. At the 0.0 or 0.1% fortification levels, and on tables with a limited number of results, the distributions are not likely normal and are probably skewed. A false positive on a 0.0% spike level is considered an outlier. At the 0.1% fortification level, outlier tests will likely identify more outliers than should be declared. Some judgment will be necessary when interpreting data at these low levels. Absolute values for z-scores that are > 2 should be scrutinized by the participating lab. Those that are > 3, or classified as outliers, are clearly suspect and action should be taken by the participating laboratory. Prior to computing the z-scores, outliers in the distribution of values were eliminated by use of the "Grubb's Test for Outliers." To

evaluate the performance as a group (i.e., inter-laboratory variation), a summary table (Table 75) was prepared to show the accuracy and precision of compiled quantification results at each fortification level for the various biotechnology-derived events.

Sample Preparation and Composition

USDA/AMS/FGIS receives 100% Biotechnology-derived event trait material from life science companies through materials transfer agreements. Specific GE trait materials are characterized at USDA/AMS/FGIS and tested for the presence of all other available traits (also used in the program) by event-specific polymerase chain reaction (PCR) testing. Occasionally, stack-trait are identified. Seed purity and zygosity characteristics are not assessed by USDA/AMS/FGIS. Commercially available and internationally recognized reference material are purchased through the Institute for Reference Materials and Measurements (IRMM) or the American Oil Chemists Society (AOCS) as finely ground flour, containing a certified percentage weight/weight (%w/w), level. USDA/AMS/FGIS uses commercially available reference standards to characterize the composition of proficiency samples prior to disseminating to participants

Biotechnology-derived event-free base material used for fortified sample preparation included both Pioneer Negative Corn (PNC), provided by Pioneer Hi-Bred International, Inc., and Popcorn provided by Amish Country Popcorn. The maize is ground to the consistency of fine flour using a high speed rotor mill, "Pulverisette 14." A 50 gram aliquot of 100% event material (corn or soy) is ground in liquid nitrogen, in a highly controlled environment using a SPEX Certi Prep 6800 Freezer Mill. The 100% event sample is stored at -20 °C until further use. The 100% event material is blended gravimetrically with well characterized non-event maize to a specified %w/w concentration. The sample sets are then analyzed by real-time PCR using USDA/AMS/FGIS in-house validated methods

The corn samples contained various combinations and concentrations of the following biotechnology-derived traits: MON810, GA21, NK603, Herculex® (TC1507), MON863, Herculex® RW (DAS-59122-7), MIR604, Event 3272, MON 88017, MON 89034, and MIR 162. The soybean samples contained various combinations and concentrations of the following biotechnology-derived traits: the biotechnology-derived glyphosate-tolerant soybeans (Roundup Ready™), the glufosinate ammonium tolerant soybeans (A2704-12), the biotechnology-derived glyphosate-tolerant soybeans (Roundup Ready™ II), and high oleic acid soybeans (DP305423). The various biotechnology-derived event concentration levels were produced on a %w/w basis. A calculated amount of ground biotechnology-derived corn or soybeans was blended to homogeneity with a calculated amount of ground non-biotechnology-derived corn or soybeans to produce concentrations ranging from 0.0 to 2.0% of a specified event. Each participant received four corn and two soybean samples. Individual samples contained approximately 5 grams of ground material.

Samples prepared at a particular %w/w fortification should in theory be concordant with consensus values as cited in the report. In many instances, however, the %w/w fortification value did not agree with analytical data generated by PCR when compared to commercially available reference standards using in-house validated methods. The trend of generating lower reported concentrations compared with gravimetric fortified values can have several possible explanations, including that of differences in trait zygosity between material used in the corn and soybean samples compared with the commercially

available reference materials. For example, USDA/AMS/FGIS in-house validated methods yield composite averages for MON810 to be about half the %w/w fortified levels; conversely, Herculex® RW composite averages were observed to be higher than the %w/w fortifications. USDA/AMS/FGIS data are consistent with historical data generated by USDA/AMS/FGIS proficiency program participants. For this reason, consensus means are used for statistical evaluation in lieu of gravimetric fortification values.

Program Participants

Participants included organizations from Africa, Asia, Europe, North America, and South America. Each participant received a study description and a data report form by electronic mail, and included with the samples. Participants submitted results by electronic mail. No analytical methodologies were specified, and organizations used both DNA and protein-based testing technologies. One hundred and five (105) organizations received samples in the October 2017 round of proficiency testing, and hundred (100) organizations submitted results to USDA/AMS/FGIS.

- Forty-eight (48) participants submitted **qualitative** results only (of these 48, four (4) participants performed a combination of DNA and protein based testing),
- Six (6) submitted **quantitative** results only (of these 6, two (2) participants performed a combination of DNA and protein based testing),
- Forty-seven (47) participants submitted a combination of **qualitative** and **quantitative** results (of these 47, two (2) participants performed a combination of DNA and protein based testing), and
- Eight (8) participants submitted **protein** based results, using Lateral Flow Strip (LFS) and/or Enzyme-linked Immunosorbent Assay (ELISA) qualitative analyses (of these 8, one (1) participant performed Enzyme-linked Immunosorbent Assay (ELISA) quantitative analysis and one (1) participant performed Lateral Flow Strip (LFS) quantitative analysis).

In this report, participating organizations are identified by a confidential “Participant Identification Number.” Appendix I identifies those organizations who gave USDA/AMS/FGIS permission to list them as participants in the USDA/AMS/FGIS Proficiency Program; several listed organizations requested that their identity remain anonymous.

Data Summary Results

Data submitted by the participants is summarized in this report primarily in tables and figures. Participants reported their results on a qualitative basis, quantitative basis, or a combination of both qualitative and quantitative bases. Qualitative results were reported as either positive (presence) or negative (absence) for a particular event in each sample. Quantitative results were reported as the concentration (% w/w) of a particular event in the sample. Due to the complexity of the data, this report summarizes the data as follows:

Qualitative Data Summaries: This section summarizes qualitative sample analysis data:

- Table 1: Qualitative results of corn fortified with 35S for all participants (DNA-based assays).
- Table 2: Percentages of correct results, false negatives, and false positives in qualitative reports of 35S for all participants.
- Table 3: Qualitative results of corn fortified with NOS for all participants (DNA-based assays).
- Table 4: Percentages of correct results, false negatives, and false positives in qualitative reports of NOS for all participants.
- Table 5: Qualitative results of corn fortified with FMV for all participants (DNA-based assays).
- Table 6: Percentages of correct results, false negatives, and false positives in qualitative reports of FMV for all participants.
- Table 7: Qualitative results of corn fortified with T25 for all participants (DNA-based assays).
- Table 8: Percentages of correct results, false negatives, and false positives in qualitative reports of T25 for all participants.
- Table 9: Qualitative results of corn fortified MON810 with for all participants (DNA-based assays).
- Table 10: Percentages of correct results, false negatives, and false positives in qualitative reports of MON810 for all participants.
- Table 11: Qualitative results of corn fortified GA21 with for all participants (DNA-based assays).
- Table 12: Percentages of correct results, false negatives, and false positives in qualitative reports of GA21 for all participants.
- Table 13: Qualitative results of corn fortified NK603 with for all participants (DNA-based assays).
- Table 14: Percentages of correct results, false negatives, and false positives in qualitative reports of NK603 for all participants.
- Table 15: Qualitative results of corn fortified with Herculex® for all participants (DNA-based assays).
- Table 16: Percentages of correct results, false negatives, and false positives in qualitative reports of Herculex® for all participants.
- Table 17: Qualitative results of corn fortified with MON863 for all participants (DNA-based assays).
- Table 18: Percentages of correct results, false negatives, and false positives in qualitative reports of MON863 for all participants.
- Table 19: Qualitative results of corn fortified with Herculex® RW for all participants (DNA-based assays).
- Table 20: Percentages of correct results, false negatives, and false positives in qualitative reports of Herculex® RW for all participants.
- Table 21: Qualitative results of corn fortified with MIR604 for all participants (DNA-based assays).
- Table 22: Percentages of correct results, false negatives, and false positives in qualitative reports of MIR604 for all participants.

- Table 23: Qualitative results of corn fortified with Event 3272 for all participants (DNA-based assays).
- Table 24: Percentages of correct results, false negatives, and false positives in qualitative reports of Event 3272 for all participants.
- Table 25: Qualitative results of corn fortified with MON 88017 for all participants (DNA-based assays).
- Table 26: Percentages of correct results, false negatives, and false positives in qualitative reports of MON 88017 for all participants.
- Table 27: Qualitative results of corn fortified with MON 89034 for all participants (DNA-based assays).
- Table 28: Percentages of correct results, false negatives, and false positives in qualitative reports of MON 89034 for all participants.
- Table 29: Qualitative results of corn fortified with MIR162 for all participants (DNA-based assays)
- Table 30: Percentages of correct results, false negatives and false positives in qualitative reports of MIR162 for all participants.
- Table 31: Qualitative results of soybeans fortified with CP4 EPSPS (Roundup Ready™) for all participants (DNA-based assays).
- Table 32: Percentages of correct results, false negatives, and false positives in qualitative reports of CP4 EPSPS for all participants.
- Table 33: Qualitative results of soybeans fortified with A2704-12 (Liberty Link®) for all participants (DNA-based assays).
- Table 34: Percentages of correct results, false negatives, and false positives in qualitative reports of A2704-12 for all participants.
- Table 35: Qualitative results of soybeans fortified with CP4 EPSPS (Roundup Ready™ II) for all participants (DNA-based assays).
- Table 36: Percentages of correct results, false negatives, and false positives in qualitative reports of CP4 EPSPS (Roundup Ready™ II) for all participants.
- Table 37: Qualitative results of soybeans fortified with DP305423 for all participants (DNA-based assays).
- Table 38: Percentages of correct results, false negatives, and false positives in qualitative reports of DP305423 for all participants.
- Table 39: Qualitative results for soybeans fortified with 35S for all participants (DNA-based assays).
- Table 40: Percentages of correct results, false negatives, and false positives in qualitative reports of Soy 35S for all participants.
- Table 41: Qualitative results for soybeans fortified with NOS for all participants (DNA-based assays).
- Table 42: Percentages of correct results, false negatives, and false positives in qualitative reports of Soy NOS for all participants.
- Table 43: Qualitative results of soybeans fortified with FMV for all participants (DNA-based assays).
- Table 44: Percentages of correct results, false negatives, and false positives in qualitative reports of Soy FMV for all participants.

- Table 45: Composite percentages of correct results, false negatives, and false positives in qualitative reports for each biotechnology-derived event for all participants (DNA-based assays).
- Figure 1: Group average of percentage correct for Qualitative reports on each event (DNA-based assays).

Protein Based Data Summaries: This section summarizes protein based sample analysis data:

- Table 46: Lateral Flow Strip (LFS) testing results for the detection of biotechnology-derived events in corn.
- Table 47: Percentage of correct results, false negatives, and false positives in qualitative reports for biotechnology-derived events in corn using Lateral Flow Strip (LFS) testing.
- Table 48: Results for soybeans fortified with CP4EPSPS and A2704-12 for participants using Lateral Flow Strip (LFS) testing.
- Table 49: Percentage of correct results in qualitative reports for CP4EPSPS and A2704-12 for participants using Lateral Flow Strip (LFS) testing.
- Table 50: Results for the detection of biotechnology-derived events in corn using Enzyme-Linked Immunosorbent Assay (ELISA).
- Table 51: Percentage of correct results in the detection of biotechnology-derived events in corn using Enzyme-Linked Immunosorbent Assay (ELISA).
- Table 52: Results for soybeans fortified with CP4EPSPS and A2704-12 using Enzyme-Linked Immunosorbent Assay (ELISA).
- Table 53: Percentage of correct results in qualitative reports for CP4EPSPS and A2704-12 using Enzyme-Linked Immunosorbent Assay (ELISA).

Quantitative Data Summaries: This section summarizes DNA based quantitative sample analysis data: z-scores were purposefully left blank on non-fortified (0.0%) samples since a z-score assumes a normal distribution and its interpretation would be distorted.

- Table 54: Quantitative results and z-scores for corn fortified with T25 for all participants (DNA-based assays).
- Table 55: Quantitative results and z-scores for corn fortified with MON810 for all participants (DNA-based assays).
- Table 56: Quantitative results and z-scores for corn fortified with GA21 for all participants (DNA-based assays).
- Table 57: Quantitative results and z-scores for corn fortified with NK603 for all participants (DNA-based assays).
- Table 58: Quantitative results and z-scores for corn fortified with Herculex® for all participants (DNA-based assays).
- Table 59: Quantitative results and z-scores for corn fortified with MON863 for all participants (DNA-based assays).
- Table 60: Quantitative results and z-scores for corn fortified with Herculex® RW for all participants (DNA-based assays).

- Table 61: Quantitative results and z-scores for corn fortified with MIR604 for all participants (DNA-based assays).
- Table 62: Quantitative results and z-scores for corn fortified with Event 3272 for all participants (DNA-based assays).
- Table 63: Quantitative results and z-scores for corn fortified with MON 88017 for all participants (DNA-based assays).
- Table 64: Quantitative results and z-scores for corn fortified with MON 89034 for all participants (DNA-based assays).
- Table 65: Quantitative results and z-scores for corn fortified with MIR162 for all participants (DNA-based assays).
- Table 66: Quantitative results and z-scores for soybeans fortified with CP4 EPSPS in Roundup Ready™ for all participants (DNA-based assays).
- Table 67: Quantitative results and z-scores for soybeans fortified with A2704-12 for all participants (DNA-based assays).
- Table 68: Quantitative results and z-scores for soybeans fortified with CP4 EPSPS in Roundup Ready™ II for all participants (DNA-based assays).
- Table 69: Quantitative results and z-scores for soybeans fortified with DP305423 for all participants (DNA-based assays).
- Table 70: Quantitative results for 35S, NOS, and FMV in corn (DNA-based assays).
- Table 71: Quantitative results for 35S, NOS, and FMV in soybeans (DNA-based assays).
- Table 72: Quantitative results for corn fortified with biotechnology-derived events using Protein Based Lateral Flow Strip (LFS) tests.
- Table 73: Quantitative results for soybeans fortified with CP4 EPSPS as Roundup ReadyTM (RUR) and A2704-12 (Liberty Link) using Protein Based Lateral Flow Strip (LFS) tests

Summary of Findings

It is recognized that some organizations participate in this program to retain their ISO accreditation. Participation also serves to provide a verification of current laboratory practices and/or aids in identifying areas for improvement. These factors should be taken into consideration when reviewing the following analyses.

USDA/AMS/FGIS does not dictate detection methods for biotechnology-derived traits. An individual laboratory may provide a Limit of Detection (LOD) for its particular detection method. When the consensus mean in an event-fortified sample falls below the provided LOD, a negative result is considered a correct answer, and is assessed as a provided negative.

- **Qualitative Sample Analysis**

DNA-based Testing. The typical method of DNA-based testing for qualitative determination of events is by conventional PCR which generally has a sensitivity of 0.01% w/w biotechnology-derived event. This level is consistent with what has been reported by Lipp et al. and represents the lowest concentration of genetic material that can be reliably detected by qualitative PCR.

The lowest gravimetric fortification level in this round of proficiency testing was 0.2% w/w; therefore, if the event was present it should be detectable by a laboratory that employs conventional PCR. As evidenced by the summary of performance scores (**Table 45** and **Figure 1**), all of the sixteen (16) biotechnology-derived events were correctly detected with greater than 90% except T25, and fourteen (14) of the sixteen (16) biotechnology-derived events were correctly detected with greater than or equal to 95% reliability, and one (1) of the sixteen (16) biotechnology-derived events were correctly detected with 100% reliability.

Eleven (11) participants reported using an End-point PCR test method. Five (5) participants reported using Digital PCR.

Protein-based Testing. The methods of protein-based testing were lateral flow strip (LFS) and enzyme-linked immunosorbent assay (ELISA). The LFS test has a sensitivity ranging between 0.1- 2.0% w/w for corn events and 0.1- 0.50% w/w for soybean events according to some kit manufacturers. Generally, ELISA has a sensitivity of 0.1- 1.0% w/w for corn and soy events (Ahmed, 2004). The test results for MON863 and MON88017 are combined because both events express the *C3Bb1* protein, and protein-based testing cannot distinguish between the two events. The event Herculex® contains the *pat* (phosphinothricin N-transferase) gene, but combining the results is problematic.

- **Quantitative Sample Analysis**

DNA-based Testing. The typical method of DNA-based testing for quantitative determination of biotechnology-derived events is by real-time quantitative PCR

(qPCR). This analytical method has a limit of detection (LOD) of 0.01% w/w and a limit of quantification (LOQ) of approximately 0.1% w/w for a specified event (Ahmed, 2004; Lipp et al., 2005).

Composite Performance Assessment. These data combined the participants' reported quantifications and evaluated the group's performance by considering the mean value of "reported results" of all participants (**Table 75**). Because test samples were fortified ranging from 0.2- 2.0 % w/w of a particular event, it was expected that qPCR technologies would detect the traits in all of the fortified samples but not in non-fortified samples. Low instances of false positive results were observed when using qPCR to detect the presence of Biotechnology-derived traits in these proficiency samples.

Nine (9) participants submitted quantitative results for 35S event in corn, seven (7) participants' submitted quantitative results for NOS event, and two (2) participants' submitted quantitative results for FMV event (**Table 70**). The target %w/w levels for these traits should be additive for all events containing either 35S or NOS fortified into the sample. Validated methods to quantify with a high degree of accuracy for the presence of 35S and NOS, in samples fortified with multiple traits, is beyond the scope of the program at this time. The number of results for soybean NOS and FMV are too small to hold statistical significance.

Seven (7) laboratories submitted quantitative results for the 35S event in soybean, two (2) laboratories submitted quantitative results for the NOS event, and three (3) laboratory submitted quantitative results for the FMV event (**Tables 71**).

One laboratory submitted Quantitative results for corn fortified with biotechnology-derived events using Lateral Flow Strip (LFS) testing (**Table 72**).

One laboratory submitted Quantitative results for soybeans fortified with CP4 EPSPS as Roundup Ready™ (RUR) and A2704-12 (liberty Link) using Lateral Flow Strip (LFS) testing (**Table 73**).

One laboratory submitted Quantitative results for soybeans fortified with CP4 EPSPS as Roundup Ready™ (RUR) using Protein Based Enzyme-Linked Immunosorbent Assay (ELISA) (**Table 74**).

Quantitative data from previous rounds of our proficiency sample distributions can be found at: <http://www.gipsa.usda.gov/fgis/proficiencyprogram.aspx>

Individual Performance Assessment. The performance of each participating laboratory for quantifying biotechnology-derived events in the proficiency samples can be observed by inspecting Tables 54 through 74. To assess the accuracy of their reported quantifications z-scores were computed. Laboratories with z-scores above +2 or below -2 were noted and highlighted in yellow because their result was greater than two standard deviations from the target value. Interpretation of z-scores assumes that the data have a normal distribution. Data from samples with lower fortification

levels (e.g., 0.2% w/w) and from tables with low numbers of results are not normally distributed and caution should be used when interpreting their z-scores.

Monitoring and improving the performance of laboratories that use PCR technologies for the detection and/or quantification of biotechnology-derived events in corn and soybeans will improve the reliability of testing methods and the marketing of these commodities. The USDA/AMS/FGIS proficiency testing program should be a complement to other quality assurance measures that laboratories use to improve their analytical capabilities.

Note: The biotechnology-derived seed or grain used to prepare these samples was made available to USDA/AMS/FGIS by the Life Science Organizations. Care was taken to ensure the biotechnology-derived material was either essentially 100% positive for the event, or adjusted accordingly. The fortified samples were prepared using a process that has been verified to produce homogenous mixes, and representative samples were analyzed to ensure proper fortification and homogeneity. Reference standards are now commercially available for all biotechnology-derived traits used in this proficiency program and USDA/AMS/FGIS encourages the use of these reference materials when developing internal validated methods.

To obtain additional information on the USDA/AMS/FGIS Proficiency Program, contact Dr. Brian Beecher at US 816-891-0453, or by e-mail at Brian.S.Beecher@usda.gov or Dr. Ramaswamy Mani at US 816-891-0418, or by e-mail at Ramaswamy.Mani@usda.gov. For questions regarding this report, contact Dr. Ramaswamy Mani at US 816-891-0418, or by e-mail at Ramaswamy.Mani@usda.gov.
